

Osborne

Platform extensions
& AFA piling

June 2016

16 weeks

We were contracted by Osborne to stabilise the ground in 7 of their 10 stations .

Commonly called Reading 10 car. The project consisted of Platform extensions and AFA station platform works. These were between Reading and London St Pancras for Southern railways.

This was done by installing some 1,100 steel cased driven piles. For the AFA works, we used 300mm diameter augered piles with a mini piling rig. We also utilised some weekend blockades to install galvanised H beams for embankment retention via RRVs and sheet piling via long reach excavators.
