

AMCO

Bridge replacement
scheme

June 2016

26 weeks

We were contracted by AMCO to undertake works associated with the Hucknall overbridge replacement scheme.

The works comprised of concrete infill works placing circa 3000m³ of concrete to existing bridge spans, foundations to new abutment wall, form a new abutment and concrete works to build the new bridge deck prior to installation.

The works also comprised of 300mm diameter 10m deep auger bored piling with permanent casings to the bridge approach walls and we undertook the associated capping beam works working under a road closure.

We provided attendants while the new bridge deck was placed and undertook associated deck end drainage works.

We finally undertook the tarmac surfacing to the new bridge deck.
